

aquaderm lipo

ANAPLASTIC OINTMENT

aquadermlipo is the ideal product for the treatment of burns and cases of skin discontinuities. Its properties of epithelial regeneration are due to its components, each of which promotes epithelialization through specific processes. Quick epithelialization means avoiding the intervention of extracellular components that cause the appearance of scars and keloids.

The composition of **aquadermlipo** includes:

Vit. A at 400000 IU (far more than in similar formulations)

Allantoin

Pantothenyl alcohol

Aquaderm 2%.

- 1. Vit. A** promotes the reproduction of epithelial cells and in this particular formulation is in a lipophilic base.
- 2. Pantothenyl alcohol** has antipruritic action. Also acts as an enhancing epithelization agent and simultaneously ensures high absorbency for Vit. A.
- 3. Allantoin** is an organic molecule with characteristic purines, found primarily in cells with regenerative functions. Enhances the proliferation of epithelial cells by enhancing the activity of Vit. A
- 4. Aquaderm 2%** is a strong hydrating agent that smooths rough skin by increasing the moisture content.

The combination of the action of the above three components, makes **aquadermlipo** **unique** for the treatment and recovery of primary and secondary lesions of the skin such as dermatitis, sores, diaper rash, surgical wounds, burns, inflammation, dry skin, diabetic foot. **aquadermlipo** is an excellent base for galenic formulations (eg cortisone).

Packaging: Soft plastic tube of 50 gr.
