Urea + Salicylic Acid + Piroctone Olamine

Results from the first days

 **MEDIMAR**

Ealk Step 1 Solution

Solution for Onychomycosis

14ml + nail file

MEDIMAR with its given expertise and high knowledge of the needs for onychomycosis, produced a new, original, effective and economical product, **EALK Step 1**.

The composition of **EALK Step 1** is unique and original. Contains **Urea 35%**, **Salicylic Acid 2%** and **Piroctone Olamine 0,5%** in a solution, in 14ml vials with brush, used as nail polish (a known and easy method, unlike other competitive products). Urea softens the nail, Salicylic Acid acts keratolytic and Piroctone Olamine is an antifungal.

EALK Step 1 is a unique product that overturns the existing time limits for the treatment of onychomycosis. The classic treatment was time consuming and demanded at least 8-12 months. **EALK Step 1** with its composition gives visible results even from the first days of application and cures onychomycosis in 2-3 months.

EALK Step 1 is applied to the affected nail (after scrape with a nail file) like nail polish. After a few minutes, a film appears and it is slowly absorbed by the nail.

We recommend to apply **EALK Step 1** Twice Daily on a scrape nail.
