

Medimar Lotion

Cleansing Lotion

Medimar **Lotion** is a formula particularly effective for the treatment of acne due to the synergistic effect of its active ingredients. Specifically, it contains **14% ammonium lactate** which acts as a keratin regulator and disrupts the stratum corneum thus allowing the exit of sebum and other residues of the epithelial cells metabolism retained in signs of symptoms of acne.

Furthermore, **ammonium lactate** helps restore normal hydration by acting as a recovery agent of normal position and alignment of cellular lipids that attract and retain water molecules. Also, thanks to the action of the ammonium lactate **Medimar Lotion** can be used to enhance combined local treatments (e.g. simultaneous topical antibiotics)

The second active ingredient of **Medimar Lotion** is **salicylic acid**, particularly known for its keratin disintegration action, and its antiseptic properties.

The third component of this product, **Dehyquart A** factor causes a light peeling when applying lotion which removes dead skin cells and prepares the ground for the action of other ingredients.

Finally, **Biosulphur liquid** is a regulator of sebum with triple effectiveness due to bacterial, anti-inflammatory and exfoliating properties, for the treatment of the "troubled" oily skin. It also has keratin disintegration, vasoconstrictor and antiparasitic activity. It is recommended for the topical treatment of skin and hair of disorders resulting from overactive sebaceous glands. This ingredient contains sulfur adsorbed nonionic hydrophilic derivatives of unsaturated fatty acids.

The centralized action of the four components of **Medimar Lotion** has the ultimate effect of reducing hyperkeratosis and sebum in the areas of symptoms of dot acne while does not cause dry skin..

Packaging: Plastic bottle 110 ml
